

Deep Learning Assisted Rate Adaptation in Spatial Modulation Links

Anxo Tato, Carlos Mosquera

atlanTTic Research Center, University of Vigo

Galicia (SPAIN)

August 28, 2019

- Increment of mobile data traffic (7x in 2017-2022)
- Mobile networks represented 0.2 % of global carbon emissions in 2017 (3x in 2020)
- Increment of M2M connections (4x in 2017-2022)
- Spectrum saturation

- **Spatial Modulation**
 - New modulation scheme for 5G and beyond 5G
 - Multi-antenna: high spectral efficiency
 - Low complexity: single RF chain
 - Better energy efficiency

Introduction

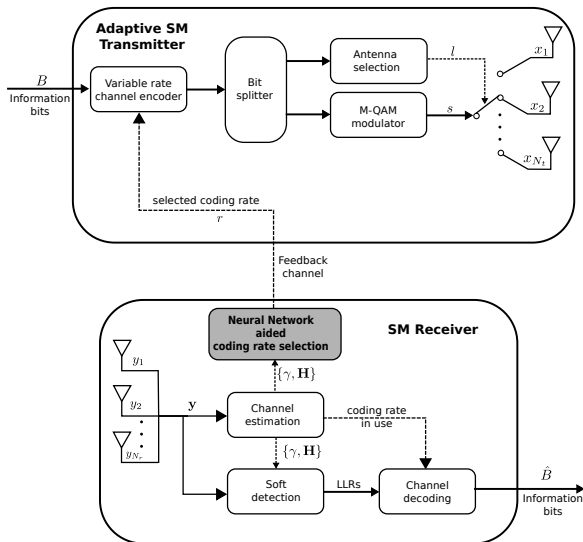

- Link adaptation

ADAPTIVE CODING AND MODULATION (ACM) (LINK ADAPTATION)

- Coding rate adaptation mechanism for adaptive SM systems
 - Supervised learning
 - Deep neural network
 - Domain knowledge: Input features extracted from the channel matrix and the SNR

Block diagram adaptive SM system

System model

- Signal model:

$$\mathbf{y} = \sqrt{\gamma}\mathbf{H}\mathbf{x} + \mathbf{w} = \sqrt{\gamma}\mathbf{h}_l s + \mathbf{w} \quad (1)$$

- SM rate adaptation problem:

$$\begin{aligned} & \underset{r}{\text{maximize}} && r \log_2(N_t M) \\ & \text{subject to} && r \in \{r_1, r_2, \dots, r_K\} \\ & && \text{BER}(\gamma; r, \mathbf{H}) \leq p_0. \end{aligned} \quad (2)$$

- Variables:

γ	SNR	\mathbf{H}	Channel matrix
\mathbf{x}	Transmitted signal	\mathbf{w}	Noise
l	Selected antenna	s	Modulation symbol
r	Coding rate	M	Constellation order
K	Number of coding rate options	p_0	Target BER

① Design phase

- ① Evaluation of the performance of the channel codes
- ② Extraction of the SNR thresholds
- ③ Building the dataset for Machine Learning
- ④ Neural network training
- ⑤ Performance evaluation

② Operation phase

- ① Neural network assisted coding rate selection by the receivers in real time.

DL based coding rate selection

- 1 Evaluation of the performance of the channel codes
System level simulations

$$\text{BER}(\gamma; r, \mathbf{H})$$

② Extraction of the SNR thresholds

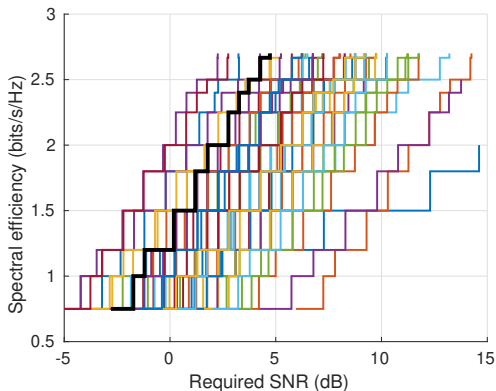

Figure 1: The minimum required SNR to guarantee a given BER p_0 with each coding rate for a set of 20 different channel matrices.

DL based coding rate selection

3 Building the dataset for Machine Learning

- Dataset $\mathbb{X} = \{(\mathbf{x}_i, y_i), i = 1, 2, \dots, m\}$
- Neural network input features:

$$\mathbf{x} = g(\gamma, \mathbf{H}) = [\text{sort}(\gamma \|\mathbf{h}_1\|^2, \gamma \|\mathbf{h}_2\|^2), \Theta_H, \varphi]^t$$

- **Columns norms scaled by the SNR**
- **Hermitian angle Θ_H and Kasner's pseudoangle φ**
between matrix columns: $\mathbf{h}_1^H \mathbf{h}_2 = \|\mathbf{h}_1\| \cdot \|\mathbf{h}_2\| \cdot \cos \Theta_H \cdot e^{i\varphi}$

- Neural network output variable: $y = r_k$ (target coding rate)

DL based coding rate selection

④ Neural network training

- Training (70 %) and validation (15 %) datasets
- Neural network configuration
 - Three hidden layers: 20+15+10 neurons
 - Activation function: tangent hyperbolic
 - Output layer: linear
- Levenberg-Marquardt (LM) backpropagation algorithm
- Cost function: MSE

⑤ Performance evaluation

- Testing dataset (15 %)
- Coding rate selection
 - $r = Q(\hat{y}) = \arg \min_{r_k} |\hat{y} - r_k|$
- Confusion matrix: accuracy, rate of under-selection, outage probability

⑥ Operation phase

- Coding rate selection with fixed neural network parameters θ

Simulated system parameters

- SM 2×2 with QPSK constellation and 9 coding rate options

Parameter	Value
Transmit and receive antennas	$N_t = 2, N_r = 2$
Constellation	QPSK ($M = 4$)
Channel coding	DVB-S2 codes (BCH + LDPC)
Coding rate options	$1/4, 1/3, 2/5, 1/2, 3/5, 2/3, 3/4, 5/6, 9/10$
Target BER	$p_0 = 10^{-4}$
Channel matrices	1000 Rayleigh distributed
SNR range	-5 to 15 dB (0.5 dB steps)

Raw classification performance (I)

$$\bullet r = Q(\hat{y}) = \arg \min_{r_k} |\hat{y} - r_k|$$

(a) Neural network output

(b) Selected coding rate index, $\Delta = 0$

- **Accuracy:** 96.2 %
- **Outage probability:** 2.1 %
- **Rate of under-selection:** 1.7 %

Raw classification performance (II)

	N/T	1/4	1/3	2/5	1/2	3/5	2/3	3/4	5/6	9/10	

Target coding rate	N/T	1/4	1/3	2/5	1/2	3/5	2/3	3/4	5/6	9/10
Accuracy (%)	98.7	95.9	91.9	94.2	93.8	91.8	94.4	89.3	89.7	99.5
Outage (%)	1.3	2.3	4.3	1.5	2.1	4.4	1.6	6.9	8.5	-
Underselction (%)	-	1.8	3.8	4.4	4.0	3.8	3.9	3.7	1.8	0.5

Table 1: Classification performance (no margin is applied, $\Delta = 0$).

Margin for reducing the outage

- Coding rate r selection with margin Δ :

$$r = Q(\hat{y} - \Delta) = \arg \min_{r_k} |\hat{y} - \Delta - r_k|, \quad (3)$$

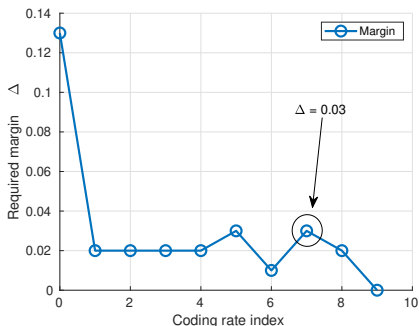

Figure 2: Required margin Δ per each target coding rate for having a zero outage probability in the testing dataset.

Classification performance with margin

	Margin		
	$\Delta = 0$	$\Delta = 0.03$	$\Delta = 0.13$
Accuracy	96.2 %	80.0 %	21.6 %
Mean accuracy ¹	92.6 %	68.1 %	4.4 %
Outage	2.0 %	0.21 % ²	0 %
Underselection	1.7 %	19.8 %	78.4 %

¹ Without taking into account N/T and 9/10.

² It already corresponds to zero outage if N/T is disregarded.

Table 2: Classification performance with and without a margin Δ .

System level performance (I)

- SM 2×2 system with a QPSK constellation and Rayleigh distributed channel matrices:

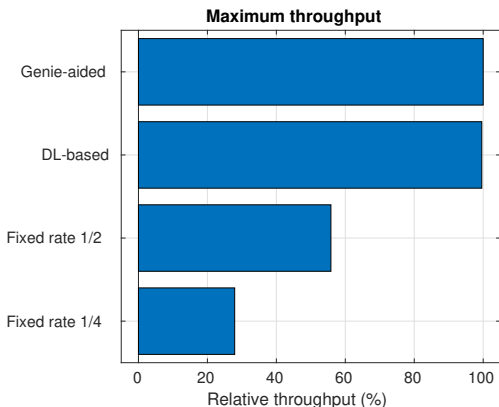

(a) Average throughput

(b) Average outage probability

System level performance (II)

- SM 2×2 system with a QPSK constellation and Rayleigh distributed channel matrices:

CONCLUSIONS

- Coding rate selection for adaptive SM systems
 - Throughput near maximum achievable
 - Outage probability reduced with a margin Δ
- Remarkable gain compared with fixed coding rate allocation

FUTURE WORK

- Extension to higher number of antennas ($N_t = 2, 4, 8$)
- Several constellations (QPSK, 8PSK, 16QAM, 64QAM)
- Selection of codebook (subset of active antennas and constellation per antenna)

Thanks for your attention!
